It's 1988, and ProDOS Thinks It's 1982	24

About Back Issues...

Don't be bashful, just tell me what you need! I have copies of all back issues in stock, at \$1.80 each, \$18 per volume, or \$120 for all seven of the completed volumes. Remember, our volume-year runs from October through September, and I started in 1980.

I also have Quarterly Disks for the entire period, \$15 each or four for \$60. Each Quarterly Disk covers a calendar quarter, so just specify which months you need. Starting with January 1986 I went to Monthly Disks, so you can get any individual month for only \$5 from then till now. Each Quarterly or Monthly Disk contains all of the source code printed in the AAL issues it covers, in the format for the S-C Macro Assembler. Early ones are all DOS, later are split with both DOS and ProDOS directories on the same disk. And since sometime last year we have also been including all of the text files for the articles themselves, as a service to readers who like to have the Echo Speech Synthesizer (or other brands) read it all to them.

Toward a New Standard Assembly Language...

Randy Hyde, who you may remember as author of the Lisa 6502 Assembler, is attempting to organize interested parties to produce a new definitive 65816 assembly language standard. He claims the existing standard, based on Orca, is confusing, overly complex, and idiosyncratic; a new standard could allow assemblers with more power than the Microsoft 8086 assembler to be written for the 65816. Right now Randy is collecting ideas and contacting key individuals (such as the authors of the various existing 65816 assemblers and 65816 books, and the chip's designer), and planning for a conference at WDC in Arizona some time this summer. If you are interested in participating in any way, write to him: Randall Hyde, 65C816 Standards, 2271 Indian Horse Drive, Norco, CA 91760.

Peeking Inside AppleWorks 1.3
+ Subroutine Call Parameter Passage
+ String Handling Subroutines.....Bob Sander-Cederlof

There are a lot of useful subroutines inside AppleWorks. I have been looking at a raw disassembly, and have learned a few new tricks. Even though AppleWorks is ProDOS-based, the subroutines are general enough that you can use them in your own code in any operating system.

All my observations are based on version 1.3, as that is the only one I have. Meanwhile, Apple has moved on to version 2.0 and turned it all over to Claris. That is all right, because I am not proposing that we use the subroutines by loading AppleWorks and calling them; I am proposing that we copy the code or some modification of it into our own programs.

When you boot AppleWorks 1.3 the first thing it does is to copy the APLWORKS.SYSTEM image down from \$2000 to \$1000. I simply loaded it there from inside the S-C assembler with "BLOAD APLWORKS.SYSTEM,TSYS,A\$1000". Then I printed out a huge listing with the monitor's "L" command, and went to work with a pencil. I don't even know what section of AppleWorks I am looking at yet, but it is chock full of interesting code I can use.

The first thing I noticed was that a lot of code did not disassemble correctly: The "L" command went weird after a lot of JSR's. It seems the author liked to call subroutines with parameters in data form following the JSR, like ProDOS MLI calls. In most cases (all I could find) there are either two, four, or six bytes of parameters after these JSR's. The subroutines all call, in turn, on a magic little subroutine which copies the parameter bytes to a standard area in page zero, starting at \$9A. This GET.x.PARMS subroutine also updates the return address on the stack so that, when the parameterized call is completed, execution will resume after the parameter bytes.

The GET.x.PARMS subroutine is shown as I found it inside AppleWorks 1.3, in lines 1300-1580. I used the .PH \$18AD line to make it look exactly the same as the AppleWorks image. The code looked a little fluffy to me, so I wrote my own version (which is shorter and swifter); you can see it in lines 1830-2070.

The AppleWorks version is evidently one of the busiest pieces of code in the system. I say that, because the author chose to poll the keyboard inside GET.x.PARMS. Line 1550 calls the POLL.KEYBOARD subroutine, which I show with comments in lines 1600-1810. I left this out of my rendition of GET.x.PARMS, because I am building a little package of routines for my own use. I included the listing here because I thought you might like to see how it is done. Notice the buffer holds only ten characters, as written.

Notice that there are three entry points to the GET.x.PARMS subroutine. The first copies four bytes following the JSR to

S-C Macro Assembler Version 2.0	DOS \$100, ProDOS \$100, both for \$120	
Version 2.0 DOS Upgrade Kit for 1.0/1.1/1.2 owners		\$20
ProDOS Upgrade Kit for Version 2.0 DOS owners		\$30
Source Code of S-C Macro 2.0 (DOS or ProDOS)	each, additional	\$100
S-C DisAssembler (ProDOS only)	without source code \$30, with source	\$50
RAK-Ware DISASM (DOS only)	without source code \$30, with source	\$50
ProVIEW (ProDOS only)		\$20
Full Screen Editor for S-C Macro (with complete source code)		\$49
S-C Cross Reference Utility	without source code \$20, with source	\$50
S-C Word Processor (with complete source code)		\$50
DP18 and DPFP, including complete source and object code		\$50
ES-CAPE (Extended S-C Applesoft Program Editor), including Version 2.0 With Source Code		\$50
ES-CAPE Version 2.0 and Source Code Update (for Registered Owners)		\$30
Bag of Tricks 2 (Quality Software)		(\$49.95) \$45 *
S-C Documentor (complete commented source code of Applesoft ROMs)		\$50
Cross Assemblers for owners of S-C Macro Assembler		\$32.50 to \$50 each
(Available: 6800/1/2, 6301, 6805, 6809, 68000, Z-80, Z-8, 8048, 8051, 8085, 1802/4/5, PDP-11, GI1650/70, Mitsubishi 50740, others)		
Beagle Bros. Applesoft Compiler (ProDOS only)		(\$74.95) \$65 *
Copy II Plus (Central Point Software)		(\$39.95) \$30 *
AAL Quarterly Disks	each \$15, or any four for	\$45

(All source code is formatted for S-C Macro Assembler. Other assemblers require some effort to convert file type and edit directives.)

Vinyl disk pages, 6"x8.5", hold two disks each	10 for \$6 *

\$9A...9D; the second copies only two bytes; and the third copies any number, which you specify in the A-register. I used a memory search to uncover all the calls on this third entry, and I only found calls which wanted to copy six bytes. There may be others, hidden in other sections of the AppleWorks code.

My more efficient rendition saves one byte by using the BIT opcode (\$2C) to skip over the two-byte LDA #2 instruction (see lines 1370 and 1870). I also save by pushing the byte count on the stack instead of saving it in RAM: the storage location is saved, and the PLA is two bytes shorter than a STA. However, I have to pull the byte back off the stack at line 2050, so the net saving is only two bytes. Line 2060, the LDY #0, can be deleted and save another two bytes (Y is already 0, in order for the loop in lines 2010-2040 to terminate). I don't need it because I have not called POLL.KEYBOARD. By the way, we do want to be sure that Y=0 here, because a lot of the subroutines depend on it. If we don't make it one of the functions of GET.x.PARMS, we will have to add a line to most of the subroutines which call GET.x.PARMS.

Inside AppleWorks a lot of string processing goes on. All of the strings I have observed are stored in memory as a length byte followed by the string data bytes. The maximum string will have 255 data bytes. A byte count equal to \$00 represents a null string. Lines 2980-3130 are my own code, simply to illustrate how you might code a subroutine to display a string stored in this fashion. Lines 3640-3690 show some strings built by the assembler. In my DEMO code, starting at line 3470, I called on DISPLAY.STRING to print these strings.

Lines 2080-2970 show my renditions of four subroutines I found inside AppleWorks, which I have named MOVE.STRING, COMPARE.STRING, APPEND.STRING, and FILTER.LC.TO.UC. These are not identical to the AppleWorks code, as I found some easy improvements here and there. I showed in comment lines where you can find these subroutines inside the AppleWorks 1.3 image. My DEMO program, lines 3470 to the end, shows some of these in action.

Not all of the subroutines which I found have to do with strings. Lines 3140-3410 show MOVE.BLOCK, which does the equivalent of a monitor "M" command. The three parameters are the destination starting address, the source starting address, and the number of bytes to be moved. (I say "moved", perhaps I should really say "copied".) A similar subroutine which starts immediately after this one, at \$1BAC, moves a block of memory "up", by starting at the last byte of the source block and moving backwards. This gives the ability to move a block of memory up to an overlapping area, without clobbering the data.

At the beginning of the code at \$1000 there is a JMP table (a long series of JMP xxxx instructions, one right after the other) which is evidently used when other segments want to use some of these general subroutines. Each of the other segments also begins with a JMP table. This is a good scheme for joining together pieces of a large system, and is easy to do. I find it a lot handier than the use of a Link Editor approach,

RamKeeper™

For the "Instant On" Apple IIGs.

Permanent Storage with an "Electronic Hard Disk"

Now when you turn on your IIGs your favorite program can appear on screen in just a few seconds! With RamKeeper, your IIGs memory card will retain stored programs and stored data while your IIGs is turned off. RamKeeper allows you to divide your IIGs memory into part "electronic hard disk" and part RAM for your programs workspace—in almost any way you want and at anytime you want. GS-RAM, GS-RAM Plus, Apple IIGs memory card and most other IIGs memory cards are compatible with RamKeeper.

Supports Up to Two IIGs Memory Cards at the Same Time

If you bought your IIGs with Apple's memory card and later wished you had the GS-RAM, no problem. RamKeeper will support both cards plugged into RamKeeper simultaneously!

How it Works

Just unplug your IIGs memory card

Steve Wozniak, the creator of Apple Computer

"I've purchased several Applied Engineering products over the years. They're always well made and performed as advertised. I recommend them wholeheartedly."

from your computer, plug your IIGs memory card into RamKeeper, plug RamKeeper into the IIGs memory slot. If you have another IIGs memory card, an additional card socket on RamKeeper will accommodate your second card. That's all there is to it!

Reliability from the Most Experienced

Applied Engineering has the most experience in the industry with battery-backed memory for the Apple so you are assured of the most reliable memory back-up system available. And in the world of battery-backed memory, reliability is everything! That's why Applied Engineering uses the more dependable Gel-Cell's instead of Ni-Cad batteries (if Ni-Cad's aren't discharged periodically, they lose much of their capacity). RamKeeper has close to 6 times (about 6 hours) the "total power failure" back-up time of other systems. When power returns, RamKeeper automatically recharges the battery to a full charge. With power from your wall outlet, RamKeeper will back-up your IIGs memory cards RAM indefinitely.

RamKeeper Has and Does It All!

- Allows instant access to your programs without slow disk delays
- Configure Kilobytes or Megabytes of instant ROM storage for your favorite programs

- Reduces power strain to your internal IIGs' power supply
- Contains back-up status L.E.D.'s
- Can support up to two IIGs memory cards simultaneously
- Supports both 256K installed memory chip boards like GS-RAM and the Apple IIGs Memory Expansion Card as well as 1 MEG installed memory chip boards like GS-RAM Plus
- 5-year hassle-free warranty
- 15 day money back guarantee
- Proudly made in the USA
- RamKeeper comes *complete* with battery, software and documentation

Only \$179.00!

(GS-RAM card shown in photo not included)

Order Your RamKeeper Today!

See your dealer or call (214) 241-6060, 9:00-11:00 CST, 7 days a week, or send check or money order to Applied Engineering, MasterCard, VISA and C.O.D. welcome. Texas residents add 7% sales tax. Add \$10.00 if outside U.S.A.

as is used under ProDOS-16. On the other hand, subroutines such as these I have shown in this article are the very type you might want to keep in assembled form as relocatable, linkable, object files, on a library ready to be used by all your future code. Even better, they are the type of subroutines I wish were in the //gs tool boxes, in ROM. And there, they would best be called via a JMP table, for efficiency. These routines are too short to afford the tremendous overhead of "real" toolbox calls.

The handiest way to use subroutines like these would involve writing macros for the calls. For example, here are some macro definitions for MOVE.STRING, APPEND.STRINGS, and MOVE.BLOCK:

```
.MA MOVE.STRING
JSR MOVE.STRING
.DA |1,|2
.EM

.MA APPEND.STRINGS
JSR APPEND.STRINGS
.DA |1,|2
.EM

.MA MOVE.BLOCK
JSR MOVE.BLOCK
.DA |1,|2,|3
.EM
```

These are simple enough, but they can make coding a program easier. If you are error prone, or simply enjoy being cautious, you might add code to the definitions to check for the correct number of macro parameters. For example, MOVE.BLOCK requires three parameters:

```
.MA MOVE.BLOCK
.DO |#=3
JSR MOVE.BLOCK
.DA |1,|2,|3
.ELSE
==> ERROR: WRONG NUMBER OF PARAMETERS. You have |#, I need 3.
.FIN
.EM
```

The line starting "==" will not be assembled as long as you have 3 parameters. If you have some other number, that line will cause an assembly error, since it starts with an illegal character. This will make it display during assembly, so you can catch and correct your call.

For example, if I try to assemble the following line:

```
1140      >MOVE.BLOCK BUFFER,SIZE
```

you will get the message:

```
>1140 ==> ERROR:  WRONG NUMBER OF PARAMETERS.  You have 2,  
I need 3.
```

Did you know you could do that? I wasn't sure, but I tried it and it works.

SPECIAL !!! EXPANDED RAM/ROM BOARD: \$39.00

Similar to our \$30 RAM/ROM dev board described below. Except this board has two sockets to hold your choice of 2-2K RAM, 2-2K ROM or even 2-4K ROM for a total of 8K. Mix RAM and ROM too. Although Apple limits access to only 2K at a time, soft switches provide convenient socket selection. Hard switches control defaults.

IMPROVED !!! II IN A MAC (ver 2.0): \$75.00

Now includes faster graphics, UniDisk support and more! Bi-directional data transfers are a snap! This Apple II emulator runs DOS 3.3/PRODOS (including 6502 machine language routines) on a 512K MAC or MACPLUS. All Apple II features are supported such as HI/LO-RES graphics, 40/80 column text, language card and joystick. Also included: clock, RAM disk, keyboard buffer, on-screen HELP, access to the desk accessories and support for 4 logical disk drives. Includes 2 MAC diskettes (with emulation, communications and utility software, plus DOS 3.3 and PRODOS system masters, including Applesoft and Integer BASIC) and 1 Apple II diskette.

SCREEN.GEN: \$35.00

Develop HI-RES screens for the Apple II on a Macintosh. Use MACPAINT (or any other application) on the MAC to create your Apple II screen. Then use SCREEN.GEN to transfer directly from the MAC to an Apple II (with SuperSerial card) or IIc. Includes Apple II diskette with transfer software plus fully commented SOURCE code.

MIDI-MAGIC for Apple II/c: \$49.00

Compatible with any MIDI equipped music keyboard, synthesizer, organ or piano. Package includes a MIDI-out cable (plugs directly into modem port - no modifications required!) and 6-song demo diskette. Large selection of digitized QRS player-piano music available for 19.00 per diskette (write for catalog). MIDI-MAGIC compatible with Apple II family using Passport MIDI card (or our own input/output card w/drum sync for only \$99.00).

FONT DOWNLOADER & EDITOR: \$39.00

Turn your printer into a custom typesetter. Downloaded characters remain active while printer is powered. Use with any Word Processor program capable of sending ESC and control codes to printer. Switch back and forth easily between standard and custom fonts. Special functions (like expanded, compressed etc.) supported. Includes HIRES screen editor to create custom fonts and special graphics symbols. For Apple II, II+, IIe. Specify printer: Apple Imagewriter, Apple Dot Matrix, C.1toh 8510A (Prowriter), Epson FX 80/85, or Okidata 92/192.

* **FONT LIBRARY DISKETTE #1: \$19.00** contains lots of user-contributed fonts for all printers supported by the Font Downloader & Editor. Specify printer with order.

DISASM 2.2e : \$30.00 (\$50.00 with SOURCE Code)

Use this intelligent disassembler to investigate the inner workings of Apple II machine language programs. DISASM converts machine code into meaningful, symbolic source compatible with S-C, LISA, ToolKit and other assemblers. Handles data tables, displaced object code & even provides label substitution. Address-based triple cross reference generator included. DISASM is an invaluable machine language learning aid to both novice & expert alike. Don Lancaster says DISASM is "absolutely essential" in his ASSEMBLY COOKBOOK.

The 'PERFORMER' CARD: \$39.00 (\$59.00 with SOURCE Code)

Converts a 'dumb' parallel printer I/F card into a 'smart' one. Simple command menu. Features include perforation skip, auto page numbering with date & title, large HIRES graphics & text screen dumps. Specify printer: MX-80 with Grafrax-80, MX-100, MX-80/100 with Grafraxplus, NEC 8092A, C.1toh 8510 (Prowriter), Okidata 82A/83A with Okigraph & Okidata 92/93.

'MIRROR' ROM: \$25.00 (\$45.00 with SOURCE Code)

Communications ROM plugs directly into Novation's Apple-Cat Modem card. Basic modes: Dumb Terminal, Remote Console & Programmable Modem. Features include: selectable pulse or tone dialing, true dialtone detection, audible ring detect, ring-back, printer buffer, 80 col card & shift key mod support.

RAM/ROM DEVELOPMENT BOARD: \$30.00

Plugs into any Apple slot. Holds one user-supplied 2Kx8 memory chip (6116 type RAM for program development or 2716 EPROM to keep your favorite routines on-line). Maps into \$Cn00-CnFF and \$C800-CFFF.

C-PRINT For The APPLE II/c: \$69.00

Connect standard parallel printers to an Apple II/c serial port. Separate P/S included. Just plug in and print!

Unless otherwise specified, all Apple II diskettes are standard (not copy protected!) 3.3 DOS.

Avoid a \$3.00 handling charge by enclosing full payment with order. VISA/MC and COD phone orders OK.

For Those Who Want the Most. From Those Who Make the Best. GS-RAM™

Now expand the IIgs' RAM and ROM with up to 8 MEG of "Instant On" memory with the all new GS-RAM!

GS-RAM has an all new design. A design that delivers higher performance including increased speed, greater expandability, and improved software.

More Sophisticated, Yet Easier to Use

GS-RAM works with all IIgs software. In fact any program that runs on Apple's smaller memory card runs on the GS-RAM. But with GS-RAM you can have more memory, improved performance, and almost unlimited expansion capabilities. We've designed the new GS-RAM to be easier to use too—you don't have to adjust the size of your RAM disk every time you use a DMA device. No other RAM card with more than 4 banks of memory installed can make the same claim.

More than Just Hardware

Each GS-RAM and GS-RAM Plus includes the most powerful set of IIgs software enhancements available anywhere. In fact, our nearest competitor offers only a fraction of the invaluable programs that we include with each GS-RAM card. This software includes the most powerful disk-caching program available, the GS-RAM Cache. The Cache will make most of your applications run up to 7 times faster. Also included is a diagnostic utility that lets you test your GS-RAM by graphically showing the location of any bad or improperly installed RAM chips. And for AppleWorks users, we give you our exclusive Expander program that dramatically enhances both the capabilities and speed of AppleWorks.

Making AppleWorks Even Better

Applied Engineering's Expander program eliminates AppleWorks internal memory limits allowing it to recognize up to 8 megabytes of desktop workspace. You can increase the limits from only 7,250 lines to 22,600 lines in the word processor and from 6,350 records to 22,600 records in the database. The Expander allows all of AppleWorks, including print functions, to automatically load into RAM. The clipboard size will increase from 255 to 2,042 lines maximum. GS-RAM will automatically segment larger files so you can save them onto multiple floppies. And

GS-RAM provides a built-in print buffer that allows you to continue working in AppleWorks while your printer is still processing text. You can even load Pinpoint or MacroWorks and your favorite spelling checker into RAM for instant response.

Grow by Kilobytes or Megabytes

We offer GS-RAM in two configurations so you can increase your memory 256K at a time (GS-RAM) or a megabyte at a time (GS-RAM Plus). Both are IIgs compatible and both come with our powerful enhancement software. GS-RAM can hold up to 1.5 MEG of 256K chips and GS-RAM Plus can hold up to 6 MEG using 1 MEG chips. And since both use standard RAM chips (not high-priced SIMMs), you'll find expanding your GS-RAM or GS-RAM Plus easy, convenient, and very economical. For further expansion, you can plug a 2 MEG "piggyback" card into the GS-RAM's expansion port for up to 3.5 MEG of total capacity. Or up to a whopping 8 MEG on GS-RAM Plus. If a GS-RAM owner outgrows 3.5 MEG, he can easily upgrade to GS-RAM Plus for a nominal charge.

Permanent Storage for an "Instant On" Apple

With our RamKeeper™ back-up option, your GS-RAM or GS-RAM Plus will retain both programs and data while your IIgs is turned off. Now when you turn your IIgs back on, your favorite software is on your screen in under 4 seconds! With RamKeeper you can divide your IIgs memory into part "electronic hard disk" and part extended RAM. Even change the memory boundaries at any time—and in any way—you want. Because

"In quality, performance, compatibility, expandability and support, Applied Engineering's GS-RAM and GS-RAM Plus are number one."

Steve Wozniak, the creator of Apple Computer

Applied Engineering has the most experience in the industry with battery-backed memory for the Apple; you are assured of the most reliable memory back-up system available. And in the world of battery-backed memory, Reliability is everything. That's why Applied Engineering uses state-of-the-art "GEL-CELL's" instead of Ni-Cad batteries (if Ni-Cads aren't discharged periodically, they lose much of their capacity). RamKeeper has about 6 hours of "total power failure" back-up time. That's 6 times the amount of other systems. But with power from your wall outlet, RamKeeper will back-up GS-RAM, GS-RAM Plus, or most other IIgs memory cards indefinitely. Should you ever have a "total power failure," RamKeeper switches to its 6-hour battery. When power returns, RamKeeper will automatically recharge the battery to full power. RamKeeper incorporates a dual-rate charger, status LED's, and advanced power reducing circuitry. RamKeeper comes complete with battery, software, and documentation.

GS-RAM's Got it ALL!

- 5-year warranty — parts & labor
- 6 RAM banks (most cards have 4)
- Memory expansion port
- ROM expansion port
- Ultra-fast disk caching on ProDOS 8 AND ProDOS 16.
- Expands AppleWorks internal limits
- Includes hi-res self test
- No soldered-in RAM chips
- Expandable to 8 MEG
- No configuration blocks to set
- RamKeeper back-up option allows permanent storage of programs & data
- 15-day money-back guarantee
- Proudly made in the USA.

GS-RAM with 256K	\$189

Enclosed is SCRNDUMP.PLUS, an enhancement to Steve Knouse's Generic Screen Dump in Apple Assembly Line, September 1983. The main enhancements are 40/80/Lores capability and, via conditional assembly, either a DOS 3.3 or a ProDOS version. The Lores capability is modified from a routine by R.M. Mottola in Nibble/#3/p.18.

The idea is to squeeze in as many features as possible and still have a utility that will fit in good old page 3 space (\$300.3CF). However, there are times you have something else in page 3 and need your screendump utility elsewhere. This is easy to do just by reassembling the screendump at another address. However, I'm lazy, and when I need a screendump utility installed I don't want to have to hunt for my assembler disk. So this version is self-relocating in that you can BLOAD and CALL to install it at any address where you have 284 bytes (\$11C) free.

This is too big to fit in page 3, so I borrowed Bill Morgan's idea from AAL/Nov.82, to use the upper part of page 2. The input trap and dump portion of SCRNDUMP.PLUS fits in page 3, while the installation takes the top of page 2. Since installation is a one-time affair, it's disposable, although it will remain there if you don't make too heavy use of the input buffer.

In addition to Steve Knouse and R.M. Mottola, I also learned and borrowed from Bill Parker's EPSON TEXT SCREEN DUMP, 1982 and Gary Little's ProDOS DUMP# utility in A+/Jul.85/p.69. I give credit to Roger Wagner's "Assembly Lines: The Book" for relocation ideas. There are a lot of neat techniques in this short utility, most of course 'borrowed' from other sources.

Now for some comments on why I chose BLOAD & CALL logic. You can install the dump via BRUN in immediate mode in DOS 3.3. However, readers of AAL know (AAL/JUN.86, AUG.86, SEP.86) that there are problems in DOS 3.3 with BRUN from within an Applesoft program. So I chose BLOAD & CALL to avoid the extra code you'd need to solve the problem. The BLOAD and CALL 41876 approach of AAL/AUG.86 is a good alternative to BRUN.

However, 3.3 DOSologists need not be ashamed, for ProDOS has its quirks also! See Call-Apple/Apr.84/p.39/Cecil Fretwell for details, but in ProDOS you must choose between a BLOAD & CALL or BRUN approach even for immediate mode! Replace Lines 2120 & 2130 by

```
2120 STX KSWL
2130 STY KSWH
2134 RTS
2138 .BS 2 (filler)
```

for BRUN logic. Again, I chose BLOAD & CALL logic for both DOS 3.3 and ProDOS to be consistent. Also, you can CALL 692 (or 2B4G from monitor) to rehook if you haven't made too heavy use of the input buffer.

Now Apple speaks IBM. Three times faster than IBM.

Introducing PC Transporter.TM The Apple® II expansion board that lets you run MS®-DOS programs.

Now your Apple II can run over 10,000 programs you could never use before. Like Lotus® 1-2-3® MultiMate® dBASE III PLUS® Even Flight Simulator®.

With PC Transporter, MS-DOS programs run on your Apple II like they do on IBM® PC's or compatibles. With one important difference. PC Transporter runs most of those programs *three times faster* than an IBM PC/XT®.

Plus, to speed through number-crunching tasks, you can use our optional 8087-2 math co-processor chip. It plugs into a socket on the PC Transporter.

Less expensive than an IBM clone.

Sure, a stripped-down IBM

clone costs about the same as the PC Transporter. But the peripherals it takes to get the clone up and running make the clone cost about three times what our American-made card costs.

You don't have to buy new hardware to use PC Transporter.

Works with the hardware you already own.

With PC Transporter, MS-DOS programs see your Apple hardware as IBM hardware. You can use the same hardware you have now.

With IBM software, your Apple hardware works just like IBM hardware. Including your drives, monitors, printers, printer cards, clock cards and serial clocks.

You can use your IIe® or IIgsTM keyboard with IBM software. Or use our optional IBM-style keyboard (required for the II Plus).

You can use your Apple mouse. Or an IBM compatible serial mouse.

Plenty of power.

PC Transporter gives you as much as 640K of user RAM and 128K of system RAM in the IBM mode.

PC Transporter also is an Apple expansion card, adding up to 768K of extra RAM in the Apple mode. The Apple expansion alone is a \$300 value.

Easy to install.

You can install PC Transporter in about 15 minutes, even if you've never added an expansion board. You don't need special tools. Simply plug it into an Apple expansion slot (1 through 7 except 3), connect a few cables and a disk drive, and go!

PC Transporter taps into the world's largest software library. Now your Apple can run most of the IBM software you use at work. And it opens a new world of communications programs, games and bulletin boards.

A universal disk drive controller.

PC Transporter supports 3.5" and 5.25" MS-DOS and ProDOS formatted diskettes. You'll shift instantly between Apple ProDOS and IBM MS-DOS.

You'll need our versatile 5.25" 360K drive system to run IBM applications from 5.25" floppy disks. Use your Apple 5.25" drive for Apple 5.25" disks.

An Apple Disk 3.5 Drive will support the new 3.5" disks whether they're IBM MS-DOS formatted or Apple ProDOS formatted. The PC Transporter acts like an Apple Disk 3.5 Drive disk controller for IIGS, IIc, and II Plus users.

PC Transporter supports up to 5 drives in a number of combinations.

For example, you can connect a 5.25 Applied Engineering 360K dual-drive system directly to the card. Then plug two daisy-chained Apple 3.5 Drives (not the Apple UniDisk 3.5) to the dual-drive system. For a fifth drive, use a ProDOS file as an IBM hard disk.

PC Transporter controls Apple and IBM compatible disk drives. It supports 3.5" and 5.25" MS-DOS and ProDOS formatted diskettes.

Versatile data storage.

PC Transporter reads MS-DOS and translates it into Apple native ProDOS. You can store IBM programs and data on any ProDOS storage device including the Apple 3.5 Drive, Apple UniDisk™ 3.5, Apple 5.25" drive, SCSI or ProDOS compatible hard drives. (You can use the Apple UniDisk 3.5 with its own controller card for storing programs and data, but not for directly booting an IBM formatted disk.)

You can even use our 360K PC compatible drive for ProDOS

Make your Apple speak IBM.

PC Transporter memory choices.

RAM in Apple mode:	RAM in IBM mode:	Price:
384K	256K	\$489.00
512K	384K	529.00
640K	512K	569.00
768K	640K	609.00

Note: The IBM mode is 128K less because the PC Transporter uses 128K for system memory.

IIGS Installation Kit	49.00
IIc/II Plus Installation Kit	39.00

PC Transporter Accessories

5.25" IBM Format 360K Drive Systems	
Single-Drive System	269.00

Heavy Duty Power Supply	69.00
(IIc and II Plus only)	

See your dealer or call or send check or money order to Applied Engineering. MasterCard, VISA and COD welcome. Texas residents add 6 1/4% sales tax.

PC Transporter produces better IBM graphics than IBM. Analog is sharper than digital. So with an analog RGB monitor, PC Transporter's CGA graphics and text are superior to IBM's digital display — even while running IBM software!

And, you can also use an Apple composite monitor in IBM text or graphics mode.

storage and a 143K Apple 5.25" drive for MS-DOS storage.

Created by Apple's original designers.

The brains behind PC Transporter were also behind your Apple II.

The PC Transporter design team includes the former project managers for the creation of the Apple IIc and IIe. The co-designer of the Apple II disk controller. And the first full-time Apple programmer and author of the ProDOS operating system.

So you know the PC Transporter and your Apple were made for each other.

Support and service from the leader in Apple add-ons.

Applied Engineering sells more Apple peripheral boards than anyone else — including Apple Computer. So you know we'll be around after the sale.

PC Transporter comes with a 15-day money back guarantee. If you're not fully satisfied after using it, return it for a full refund. PC Transporter also comes with a 1-year warranty.

How to get your PC Transporter today.

See your dealer. Or call Applied Engineering any day between 9 a.m. and 11 p.m. CST at 214-241-6060.

AE Applied Engineering
The Apple enhancement experts.

P.O. Box 798, Carrollton, TX 75006

Now to describe the utility in more detail. Lines 1540-1630 find where it has been BLOADED. I think it's a good idea to inhibit interrupts while getting information from the stack. Then lines 1640-1720 modify (SETRAP+1) and (SETRAP+3) to point at TRAP. Lines 1730-1900 put the current INPUT address at TRAP+1.TRAP+2 and TRAP+8.TRAP+10: the first so we can 'daisy-chain' our input TRAP at the end of the current INPUT routine, and the second so we can terminate via CTRL-T to remove our INPUT trap. Lines 1910-1980 set default parameters at locations 6-9 and \$ED. If you BLOAD without CALL-ing, you must set these parameters yourself. As far as I can tell, there are 11 page 0 locations not used by Applesoft, Integer Basic, DOS 3.3, ProDOS (including interrupt handlers), or the System Monitor. They are 6-9, \$1E, \$EB-EF, and \$F9.

Anyway, 6 (PRFLAG) is used as an enable/disable (1/0) flag- for when you want to disable dumping without removing the input trap. 7 (WINTOP) and 8 (WINBOT) are used to set a 'window' to dump if you don't want to dump the whole screen. Here the top line is 0 and bottom is 23 (\$17). Note that I couldn't fit left and right margin windows in. If you want a routine that does both 40 and 80 column dumps you'll have to be careful in adding left and right margins. \$ED (FLAG) is used to flag if a dump has been done via CTRL-P from the TRAP (value \$FF) or just a CALL 802 (JSR \$322) (value 0).

SETRAP, Lines 2050-2150, hooks TRAP into DOS or ProDOS.

TRAP, our input 'filter', does its thing by first daisy-chaining to the current input routine and letting it do all the dirty work. Only then does TRAP check for either CTRL-T (Terminate TRAP and reset input hooks) or CTRL-P (Print the screen). If neither, exit to caller of input routine. If a CTRL-P, Set FLAG (\$ED) to \$FF to show we came thru TRAP. This avoids a JSR DUMP, which would not be relocatable. You could have a JSR DUMP with address filled in during the first portion of the utility just like SETRAP+1, +3 are filled in from Lines 1640-1720. That way you wouldn't need FLAG at all, but the approach takes 3 more bytes. Roger Wagner's book has other ways to do a relocatable JSR, but remember that we want a DUMP that can be called either directly or from TRAP.

Note that lines 2280 and 2290 inside TRAP avoid another ProDOS 'gotcha'. A JMP \$3D0 (DOS.WARM) in ProDOS (Q from IIgs Monitor) returns to immediate mode but erases Applesoft variables, unlike the friendly DOS 3.3! Thanks to Steve and Marsha Meuse for this one (Nibble/Nov.85/p.20). So from ProDOS JSR RSTINT and JSR BASIC2 exit without erasing variables. BASIC2 (\$E003) is the address a CTRL-C <Return> from monitor uses. RSTINT (\$9A17) is the same in BASIC.SYSTEM versions 1.0 and 1.1, the only ones so far. Future versions may change, so beware.

For the DUMP itself, we disable interrupts and save the A-X-Y registers, the cursor location CH (so after the dump is done you end up with the cursor where it was when you started), and the output hooks, in lines 2370-2490.

Lines 2510 and 2520 test the enable flag and exit if it's zero. Lines 2530-2650 simulate a PR#SLOT, and kill video echo. Change SLOT in Line 1060 if printer isn't in slot 1, and change NOAIO to 0 in Line 1080 if you have an AIO interface, which is code from Steve Knouse.

Lines 2670-2720 start the dump with screenline specified by WINTOP. In Lines 2730-2820 we handle 80-column dumps. This is good only for //e or //c or IIgs using firmware 80-column routines. There are too many video interface cards that work in different ways to support them all. Some cards have their own dump utilities, so you may not be out of luck if you have a non-standard interface. In line 2810 I use \$FF to flag the X-register if 80-columns are active. Otherwise, lines 2840-2870 in MORCHR will end with X in range 0-23. That way in Lines 3090 and 3100 if X gets incremented to 0 then branch back to MORCHR to get even column character, so $2*40=80$ characters/line get dumped. This trick of using a register value out of the range you would normally get in the rest of your code is a handy way of saving bytes.

In Line 2840 PRFN gets tested. 0->LORES, and 1->TEXT. If LORES, still only do a mixed mode dump of 20 LORES lines and 4 TEXT lines. Replace Line 2880 by 2 NOP's (\$EA) to do full-screen LORES. Note that if you're in 80-column mode, the odd columns are dumped as text regardless of PRFN, since 2820 skips MORCHR. So this dump doesn't do double-LORES. Also, your LORES-creating program should start with TEXT:HOME:GR since TEXT:HOME clears even 80-columns to spaces, whereas GR only clears 40 columns to nulls. If you just do GR, some text may be left in the aux memory text pages, and you'll see it when you do a LORES dump.

So a LORES dump in 80-column mode still dumps only 40 column LORES, spaced out (if you did TEXT:HOME:GR) to match the 4 lines of 80-column text at the bottom.

In Lines 2890-3010 a quasi-40-by-40 resolution for LORES is done by using a space for both LORES blocks off, a caret for top LORES block on, an underline for bottom LORES block on, and an X for both LORES blocks on. This should work for most printers, but feel free to use other characters or symbols, especially if your printer has graphics. The resulting dump is good for monochrome LORES pictures, and especially Bar Charts. Multi-colored LORES and even abstract monochrome patterns lose a lot in the 'translation' to print.

Note especially how 2910 turns off the lo-nibble, while the exclusive-or in 2930 turns off the hi-nibble and turns back on the lo-nibble. Exclusive-or is a handy opcode to learn, and to save bytes by using. Also, the BIT opcode is used in Lines 2960, 2980, and 3000 as a 2-byte NOP to skip the following 2 bytes. BIT changes the N,V, and Z flags, but since 3020 does another CMP anyway, this doesn't matter here. Another 'gotcha' is to avoid inadvertently toggling a soft-switch in the \$C000-\$C0FF range via BIT. I did that once and it took me a long time to figure out!

Lines 3020-3050 make sure a value of \$A0 or greater is sent to printer, to avoid control or inverse or flashing characters. Line 3060 then masks off the MSB to avoid graphics in EPSON printers. Lines 3080-3190 send the character to the printer and do loop checking for 80-columns, line length, and WINBOT screen checking.

Lines 3210-3410 restore everything saved upon entry to DUMP. If FLAG was set to show we came thru TRAP, it's cleared in case next time we don't. Besides, if we came thru TRAP, we're in input mode and need to JMP RDKEY to get the next keystroke. If we didn't come thru TRAP, we can just exit via RTS.

Some Demonstrations

So much for the dump. Now it's time for some demo programs. The following, which I call CHARDEMO, shows the active character set, including MouseText if you're in 80-column mode. //e's, c's, and IIGs's have different character sets for 40 and 80 column modes, and you'll see that most printers match the 40-column character set best for INVERSE and FLASHing characters. So what you dump isn't always what you see! If you avoid MouseText and INVERSE and FLASH, you'll do all right except that most printers use code \$7F=127 as 'delete previous char' instead of a checkerboard. So if you don't see a tilde (code \$7E=126) or a checkerboard, you'll know what happened.

```
5  REM CHARDEMO
6  PRINT CHR$(4)"BLOAD SCRNDUMP.PLUS"
7  CALL 692: REM INSTALL HOOKS
10  INVERSE
20  PRINT CHR$(27);"@ABCDEFGH IJKLMNOPQRS
   TUVWXYZ[\]^_"; CHR$(24)
30  NORMAL
40  GOSUB 1000
50  INVERSE : GOSUB 1000: NORMAL
60  FLASH : GOSUB 1000: NORMAL
70  END
1000 FOR I = 32 TO 127: PRINT CHR$(I);: NEXT
1010 PRINT : RETURN
```

TESTGR does a LORES dump by CALLing DUMP directly. Try in 40 and 80-column mode to see the difference.

```
5  TEXT : HOME : GR
10  COLOR= 15
20  FOR I = 0 TO 39
30  VLIN I,39 AT I: NEXT
40  PRINT "THIS IS A TEST."
50  POKE 9,0: CALL 802: POKE 9,1
60  REM ASSUNES M/L BLOADED & PARAMETERS SET
```

TEST40 and TEST80 merely show that no top lines or characters get dropped.

```
5 TEXT : HOME
10 FOR I = 1 TO 22
20 PRINT "LINE NUMBER ";I;: HTAB 16
25 PRINT "THIS IS A TEST."
30 NEXT
```

```
5 TEXT : HOME
10 FOR I = 1 TO 22
20 PRINT "LINE NUMBER ";I;: HTAB 16
25 PRINT "THIS IS A TEST.";
26 FOR J = 1 TO 40: PRINT "A";: NEXT : PRINT
30 NEXT
```

LORES.PIC, adapted from a David Thornburg program to do LORES and not HIRES patterns, allows you to experiment with patterns. Try Inputs x=0,y=0,s=field size=10, and 2 colors to see an abstract monochrome pattern-it loses a lot in the translation to print.

```
5 REM LORES.PIC/DAVID THORNBURG/A+/DEC.86&JUN.87
6 REM ASSUMES M/L BLOADED & PARAMETERS SET
7 POKE 9,0: REM FOR LORES DUMP
10 PRINT "ENTER STARTING X-VALUE ";
20 INPUT A
30 PRINT "ENTER STARTING Y-VALUE ";
40 INPUT B
50 PRINT "ENTER FIELD SIZE ";
60 INPUT S
70 PRINT "ENTER NUMBER OF COLORS (2-16) ";
80 INPUT N
90 TEXT : HOME : GR
100 FOR I = 0 TO 39
110 FOR J = 0 TO 39
120 X = A + (S * (I - 20) / 100)
130 Y = B + (S * (J - 20) / 100)
140 Z = 10 * SIN (X * X) + 10 * SIN (Y * Y)
160 COLOR= (Z - (N * INT (Z / N)))
170 PLOT I,J
180 NEXT J
190 NEXT I
200 CALL 802: POKE 9,1: REM DUMP, THEN BACK TO TEXT
DEFAULT
```

Try changing Line 140 to $Z = X^2 + Y^2$ and use inputs 0,0,25,2 to see circles. If the pattern isn't too abstract, the resulting dump is ok. Also try $Z = X*Y$ and inputs 0,0,20,2 to see hyperbolas. It's a neat program to play with, but unfortunately abstract and/or multi-colored patterns go past the capabilities of the simplistic LORES dump here.

```

EnterSoft:

Basic-like macros which make the complex simple. Don't re-write that multiplication routine for the hundredth time! Get EnterSoft instead! Do 8/16/32/64 bit Math/Input-Output/Graphics simply without all of the hassles. These routines are a must for the serious programmer who doesn't want to spend all of his/her time trying to re-invent the wheel. DOS 3.3 Version=\$30.00, ProDos Version=\$30.00, BOTH for only \$50.00. GET YOURS TODAY.

A Shape Table Program:

For oncel A shape table program which is logically organized into its componet parts. Each section resides in its own program. The editor, disk access, Hi-Res section; each section is separate. Written almost entirely in Basic, it is easily modified. Not copyprotected! Put them on a Hard Disk, Ram Drive, anywhere! DOS 3.3 Version=\$20.00, ProDos Version=\$20.00, BOTH for \$30.00!

Send Check or Money Order To:		ProDos Upgrade for DOS 3.3 EnterSoft Owners = \$20.00

DON LANCASTER STUFF

INTRODUCTION TO POSTSCRIPT

A 65 min user group VHS video with Don Lancaster sharing many of his laser publishing and Postscript programming secrets.

Includes curve tracing, \$5 toner refilling, the full Kroy Kolor details, page layouts, plus bunches more.

\$39.50

FREE VOICE HELPLINE

ASK THE GURU

An entire set of reprints to Don Lancaster's ASK THE GURU columns, all the way back to column one. Edited and updated.

Both Apple and desktop publishing resources are included that are not to be found elsewhere.

\$24.50

APPLE IIc/IIe ABSOLUTE RESET

Now gain absolute control over your Apple! You stop any program at any time.

Eliminates all dropouts on your HIRES screen dumps. Gets rid of all hole blasting. For any IIc or IIe.

\$19.50

POSTSCRIPT SHOW & TELL

Unique graphics and text routines the others don't even dream of. For most any Postscript printer.

Fully open, unlocked, and easily adaptable to your own needs. Available for Apple, PC, Mac, ST, many others.

\$39.50

VISA/MC

It's 1988, and ProDOS Thinks it's 1982....Bob Sander-Cederlof

If you are still using ProDOS 1.1.1, and you have some sort of clock card such as Thunderclock, TimeMaster, or any other "standard" ProDOS clock, you have a problem. Apple built this bug into ProDOS, and they came out with the new versions (they call it ProDOS-8 version 1.4 now) just in time.

In my article about the clock driver in the November 1983 issue of AAL (pages 25-28), I discussed the problem. It seemed a little more remote at the time. Apple based ProDOS on the Thunderclock, even though that device does not keep track of the year. The ProDOS clock driver reads the Month, Day, and Day of Week information and does some arithmetic to determine which of six years could produce that day of week on the corresponding month and day. ProDOS 1.1.1 and earlier versions could produce dates from 1982 through 1987. When 1988 rolled around a few weeks ago, hundreds of thousands of Applers around the world slipped back in time to 1982.

And it is not funny! Some programs will not let you operate if the dates are not correct!

Well, there are at least four ways around the problem. You can remove your clock card, and type the date in manually wherever it is really needed. Not very nice.

Or, you can get the up-to-date version of ProDOS, now called ProDOS-8 Version 1.4. You can get it, and then you can copy it to every floppy (both 3 1/2 and 5 1/4), to every RamFactor, to every hard disk in sight. This is tedious, but it is the best solution. If you have a friendly dealer, you can get it from the IIgs system disk. But don't copy the file named PRODOS from this disk (that is only a loader now). Instead, copy the file named P8 from the subdirectory SYSTEM. P8 is a longer file than version 1.1.1 of PRODOS was, so if you use BSAVE to put it on your disks be sure to specify the L parameter. Something like this should do the trick:

Boot any ProDOS disk, preferably one with version 1.4 so the correct dates will get into the file directories you are updating. Get into the S-C Macro Assembler or Applesoft. With the latest IIgs system disk in your drive, type:

```
BLOAD SYSTEM/P8,TSYS,A$2000
```

Now put the disk you want to update into a drive, and type the following. You may want to include slot and drive parameters, or set the prefix to the appropriate value for a ram disk or hard disk.

```
UNLOCK PRODOS
BSAVE PRODOS,TSYS,A$2000,L$3C7D
LOCK PRODOS
```

A third approach saves you a trip to the dealer. You can simply PATCH the copies of ProDOS version 1.1.1 to give you the correct year. When you BLOAD the file named PRODOS at \$2000, the six-year table is at \$4F76. If you look there now you will find the following bytes:

4F76: 54 54 53 52 57 56 55

These correspond to the years 1984, 1984, 1983, 1982, 1987, 1986, and 1985. Notice that 1984, being a leap year, takes up two of the values. Patch these seven bytes, using the monitor, as follows:

4F76:5A 59 58 58 57 56 5B

The table now includes the years from 1986 through 1991. If you want 1992 in there also, substitute 5C where I have 57 and 56 above. Both 1988 and 1992 are leap years, so they both take two table positions. When ProDOS 1.4 was released it was still 1987, so there was not room for 1992 in the table.

A fourth possible solution was suggested by reader Garth O'Donnell. You can replace the clock driver inside ProDOS with one that reads the year directly from your clock card! This is what happens when you boot Version 1.4 in a IIgs, because P8 senses that you are in a IIgs and plugs in a different driver. But if you are still using an older Apple, as most of us are, you can modify the PRODOS file to load an intelligent driver for your own clock card. Of course, if you are using a Thunderclock, the driver with the above patches is the best you can do. But if you have a TimeMaster, as Garth does, you can use a program like he wrote.

I decided to try my hand at modifying the standard clock driver so that it uses the year information in the TimeMaster. The following program is derived directly from the standard driver, with as few modifications as possible. It still resides in the ProDOS SYS file at \$4F00, but it is a lot shorter. (Maybe you can think of something useful to do with the extra 45 bytes!) It still depends upon the standard ProDOS loader to plug in the actual slot number in lines 1260 and 1310. The major change I made was to call on the ":" instead of the "#" mode. The "#" mode is a ThunderClock mode, which does not return the year. The ":" mode is a TimeMaster mode, which does return the year.

If you have an Applied Engineering Serial Pro card, which includes a TimeMaster compatible clock, you can use the driver I wrote by making the single change as shown in the comments on line 1090. Or, maybe you could use those extra 45 bytes for a subroutine that would check which clock is in the slot and make the appropriate changes at run time.

```

PROGRAMMER

Applied Engineering is seeking an experienced 6502 and 6816 machine language programmer. 2 years minimum programming experience is required. We offer an exciting opportunity for the experienced programmer to take his skills to the limit. Applied Engineering offers an excellent compensation package including paid vacations, 11 paid holidays per year, health insurance program and more.

Applied Engineering's location in the suburbs of north Dallas offers a "buyer's market" for housing, as well as excellent schools, shopping and entertainment.

Successful applicant should have heavy machine language experience on the Apple IIe and IIgs as well as familiarity with AppleWorks. We're the best at what we do; if you are too, please send your resume to:

PROMGRAMER™

Hardware design by Bob Bice

Software by Bob Sander-Cederlof

The PROMGRAMER is an inexpensive EPROM (Erasable Programmable Read Only Memory) programmer for the APPLE II, II+, and IIe computers. The unit plugs into any slot of the computer, and allows the user to program any standard 5 volt, 27 series EPROM. Although not intended as a production tool, the ease of use allows rapid programming, copying, duplication, or modification of EPROMs.

FEATURES:

- Programs all single-voltage 27XXX series EPROMs from the 2708 to the 27512.
- Also does CMOS versions of above EPROMs.
- Choice of standard or fast programming algorithm.
- Disk-based software allows easy customization.
- Source code included (S-C Assembler).
- Files can be saved under standard DOS 3.3.
- On-board voltage generator—no messy wires or transformers.
- Zero-insertion force (ZIF) socket for ease in changing EPROMs.
- Complete—no personality modules needed.
- Slot independent for maximum flexibility.

**SOUTHERN CALIFORNIA
RESEARCH GROUP**

S-C Software Corporation

2331 Gus Thomasson, Suite 125, P.O. Box 280300, Dallas, Texas 75228 (214) 324-2050

Our software is not only unlocked and fully copyable...we often provide the complete source code on disk, allowing you to understand how it works and make your own personal extensions.

S-C Cross Reference Utility: A support program which works with the S-C Macro Assembler to generate an alphabetized listing of all labels in an assembly language source program, showing with each label the line number where it is defined and all the line numbers containing references to that label. Works with multi-file source programs. The ProDOS version automatically follows the .IN or .INB ("include file") directives and assigns a code-letter to each included file in the cross reference listing. We include the complete source code for this amazingly fast program, in both DOS and ProDOS versions, for only \$50.

S-C DisAssembler: An intelligent two-pass disassembler which works in conjunction with the ProDOS version of the S-C Macro Assembler. Converts files of 6502 or 65C02 machine language programs into meaningful source code files complete with labels. Driven by a script you write in a convenient "disassembly" language, allowing you to define label names of your choice, process all or part of input files, and many other options. A built-in option produces comment lines before each label showing all reference points to that label. Comes with complete commented source code and easy-to-understand documentation, for only \$50.

Laumer Research Full Screen Editor: Integrates with the built-in line-oriented editor in the S-C Macro Assembler to provide a powerful full-screen editor for your assembly language source files. Drivers for Videx, STB80, and Apple //e (and //c) 80-column boards are included, as well as a 40-column version. Comes with complete source code, with both DOS and ProDOS versions, for only \$49.

ProVIEW, by Doug McComsey: A professional tool for "zapping" ProDOS disks and memory. On an Apple //c, //e, or //gs in 80-column mode ProVIEW gives you a 256-byte window into RAM, ROM, ProDOS files, and disk blocks. You can examine, modify, and update any portion of RAM, a file, or a disk block. Operates from a series of menu screens much like Appleworks, with complete HELP available at every step. Only \$20!

S-C Word Processor: The one we use for manuals, letters, our monthly newsletter, and whatever. 40-columns only (II and II+ require lower-case display mod and shift-key mod). Works with standard DOS text files, but at super fast speeds (100 sectors in 7 seconds). No competition for Word Perfect, but you get complete source code! \$50, DOS only. We also will include at no extra charge two additional disks. One contains the source and object code for an 80-column //e, //c, //gs. We use this one, but it has a few cosmetic un-features. Sorry, still only in DOS 3.3. The other disk contains the source and object code for a 40-column version which runs under ProDOS, on any ProDOS machine. We use both of these, but they are not as polished as the original. All for only \$50!

S-C Double Precision Supplement for Applesoft: Two complete packages for the price of one! Only \$50 gets you the complete commented source code for both DPFP and DP18, with documentation. DPFP gives you 21-digit floating point precision for INPUT, PRINT, and +-*/* operations. DP18 is more complete, offering all of the math operations and functions, formatted I/O conversions, and 18-digit decimal floating point. DP18 is ideal for writing programs which deal with money. Both packages use the "k" command in Applesoft to add the new capabilities, without losing any of the old. DP18 includes both DOS and ProDOS versions, DPFP is DOS only. Detailed internal documentation for DP18 was published in 12 consecutive issues of "Apple Assembly Line", and is available for an additional \$18.

Apple Assembly Line (ISSN 0889-4302) is published monthly by S-C SOFTWARE CORPORATION, P.O. Box 280300, Dallas, Texas 75228. Phone (214) 324-2050. Subscription rate is \$18 per year in the USA, sent Bulk Mail; add \$3 for First Class postage in USA, Canada, and Mexico; add \$14 postage for other countries. Back issues are \$1.80 each (other countries inquire for postage). A subscription to the newsletter and the Monthly Disk containing all source code is \$64 per year in the US, Canada and Mexico, and \$87 to other countries.
